N-linked oligosaccharides are known to have a common precursor structure. Through a series of reactions, they are modified into complex species that may vary according to the type of cell and the stage of its development. N(+)-sulfogalactosyl acyltransferase, which modifies the terminal residue of the carbohydrate units, has been identified by using N-acetylglucosamine and lactose as substrates.apiVersion: extensions/v1beta1 kind:

A murine vascular smooth muscle cell (VSMC) subline was used to characterize the effect of the vasoconstrictor, endothelin-1 (ET-1) on intracellular calcium concentration ($[Ca2+]i$). Exposure of VSMC to ET-1 for 2 min elicited a transient increase in $[Ca2+]i$ followed by an oscillation of $[Ca2+]i$. Oscillations in $[Ca2+]i$ were

rapid, reaching a peak value (0.25-0.5 mmol/L) within 10 to 20 seconds of ET-1 exposure and then decaying rapidly to a level Q: Show $e^{\frac{-1}{\sqrt{x}}}=\sum_{n=0}^\infty\frac{1}{n!\sqrt{x}}\left(1-\frac{1}{\sqrt{x}}\right)^n$ Show 82138339de
