History of AutoCAD AutoCAD is a replacement for "Auto-Plot", a software product released in 1978 by the same company which evolved into AutoCAD, introduced in 1982. Auto-Plot was a small, simple-to-use yet powerful CAD application originally designed for use by students, students, and teachers who needed to make simple drawings and diagrams in a small office or classroom setting, at a time when the majority of CAD software was oriented to the manufacturing industry. Although marketed in some circles as "AutoCAD", Auto-Plot was often referred to as "AutoPLT", indicating the acronym "Auto" had been removed and the word "Plot" had been added to make the product easier to pronounce. The AutoPLT product was a runaway success, and eventually evolved into the "Autodesk AutoCAD" product that exists today, beginning in 1983. AutoCAD Development Team AutoCAD was created by a team of industrial designers, software developers, and test and design engineers, based in San Rafael, California. Senior level management, including Bill Trifunovic, Brian Addison, and Frank Burns, acted as mentors and guides for the development team. They were given significant latitude to make a product that was distinct from its predecessor AutoPLT. Unlike AutoPLT, AutoCAD was a true CAD system, with features such as data management, mechanical engineering, electronic drafting, planning, and programming, in addition to simple 2D drafting. Although AutoCAD was marketed as a replacement for AutoPLT, many of the AutoPLT users found the more complex features of AutoCAD as well as the interface enhancements and ease of use improvements to be irresistible. The first version of AutoCAD was released in 1982. The version was originally known as "Auto-Plot" and was a small, simple to use, yet powerful CAD application. The original release date of AutoCAD was December 1, 1982. It was the successor to AutoPLT, which was developed and released in 1978 by the same company that evolved into AutoCAD. AutoPLT was a small, simple-to-use yet powerful CAD application, which was intended for use by students, students, and teachers who needed to make simple drawings and diagrams in a small office or classroom setting, at a time when the majority of CAD software was oriented to the manufacturing industry. AutoPLT was developed by the California State Polytechnic University of San Luis Ob

The Medicare cuts in the House bill don't get any votes, because of the usual stratagem of treating any vote for cuts to the bill as a vote to repeal Medicare, no matter how small. What about the Senate? The Senate bill, by contrast, does have a way to achieve repeal of the cuts. Republicans know, of course, that they can never actually repeal Medicare, but it doesn't really matter if the cuts don't go through. So they can pass a bill that delays the cuts, and then have it vetoed by the President. Why then didn't Republicans just pass a bill that repeals the Medicare cuts? They could have done so easily; the Senate version does just that. But they didn't. Why not? I think it was the same as the vote on the fiscal cliff: moderate Republicans were in a state of panic, and did not want to be 5b5f913d15
