When you open the application for the first time, you are required to specify the workspace default location where all the projects and settings will be saved. After that, you can start creating diagrams by selecting the ones you are interested in from the left panel. Then, a blank page will open, allowing you to drag and drop the objects you need to create representations of system components and organize business processes. However, the second panel (which appears each time you select a diagram) will always change accordingly to the diagram you choose to create. For instance, if you want to create an Activity Diagram, objects like actors and dependency relations are not presented in the panel. Each diagram is customized with its own objects and relations. Visualyze and analyze system hierarchies The menus are well-organized and allow you to perform actions easily such as configuring a database, irrespective of its type, be it MySQL, SQL Server, Oracle, PostgreSQL, Firebird or Frontbase, configuring stereotypes and requirements, or generating HTML reports. Using the 'SoaML Modeling' option you are able to describe the use of services in systems architecture. You can access various SoaML diagrams in order to facilitate easy and proper development of Soa model. Another option that helps you to gain insight to interconnections between system components is SysML (displayed in the main toolbar). Each of them allows you to describe the internal structure of a system and helps you to visualize your system hierarchy in an easy to understand environment. As an all-in-one enterprise architecture utility, Agilian Enterprise comes with several options that allow you to share your work and one of them is entitled 'Teamwork'. Using this feature, you can allow teams to collaborate and work together in parallel on a structured platform. A few last words Overall, Agilian Enterprise proves to be a steady and straightforward diagram designer intended for software developers who need to create

With Agilian Enterprise you can create a number of diagrams, such as Activity, Use Case, State Diagram, Composite, Use-Case State-Transition and CMMN. All these diagrams can be opened in one environment and can be customized according to your own needs. This means that all diagrams are absolutely identical but each of them has its own objects, relations and other properties. The main tool for creating diagrams with Agilian Enterprise is the one that comes with the product and is titled 'Diagram'. It allows you to drag and drop objects with different shapes and sizes as well as to add nodes, arrows, lines, text and properties to them. After that, you will be asked to save the diagram. With Agilian Enterprise you can set projects and preferences in relation to workflow diagrams, thereby facilitating your work and saving you the time you need to download the component libraries. You can also create flowcharts, charts and UML class diagrams for illustration purposes. The Diagram Toolbox The Diagram Toolbox is the first tool you will use to create Business Process, Class, Sequence, State, State Map, Event, Structured, Use Case and Activity diagrams. It is designed to be easy and convenient to use. After all, it is good to take some time to gain essential understanding of how it works in order to be more confident when using it. What's New in the Agilian Enterprise?

Enterprise Architecture and Business Process are two words that are often used without the understanding of what they mean. Enterprise Architecture is about describing the existing business strategy, information system organization and the business processes. Business process is defined as all the steps that are involved in the execution of a business activity. When Agilian Enterprise (formerly Artima) started, our user's biggest problem was to create those diagrams to fulfill the business needs. We wanted to give them a quick way to create corporate and governance architecture diagrams using J2EE and BPMN. Agilian Enterprise gives users a free platform to create Enterprise Architecture Diagrams. Using Agilian Enterprise, you will have a better way to describe, understand and manage your corporate and corporate governance assets. Meet Agilian Enterprise Enterprise Architecture and BPMN (Business Process Modeling Notation) share the same technology to draw diagrams. They both use a notation that is similar to the one used by humans to describe business processes and diagrams for business and architecture views are similar. Enterprise Architecture is not the same as Business Process Modeling. EA (Enterprise Architecture) is a whole description about an organization's business goals. It includes architectural views, functional overviews, physical layout, and network diagrams. Business Process Modeling (BPMN) is not about the organization's architecture, but it helps users to understand and visualize the business process. Enterprise Architecture can be created by using XML, UML or BPMN diagrams. However, when you export the diagram in BPMN, it can be easily imported

into a diagram editor and become an UML diagram. BPMN is not only used in EA diagrams. It can be used in a variety of scenarios such as quality management, web services, and intranets. With the help of BPMN diagrams, you can easily identify the main workflow, and find the best places to apply the process. Agilian Enterprise is just a diagram editor and uses BPMN notation to create enterprise architecture diagrams. Why Agilian Enterprise? Agilian Enterprise helps users to create and collaborate by facilitating a uniform enterprise architecture diagram generation framework. Using this software, you are able to design, share and analyze any type of business architecture and view a system's structure. This tool is designed to allow people to design and analyze any type of EA using BPMN notation. Agilian Enterprise gives you the following:
