Q: Restricting text with PHP to a specific width I have a form, in which I input information, and a table with a bunch of text (like the name of the input). The text is generated by the data entered in the inputs. I want to make sure that the text stays within a certain width and if it exceeds that width, it will wrap and go to the next line. How can I do this with PHP? A: "How to limit the width of a paragraph in a fixed-width font?" It's called wordwrap, using str\_word\_wrap. It can be made to limit the width, or just wordwrap off. If the length exceeds the wordwrap limit, it wraps onto the next line. 1. With Markup Import, you can import parts directly into a drawing from a large number of file formats. And by using a dedicated software utility called Markup Assist, you can assign metadata to those parts, making them easier to find and identify. And with Markup Assist, you can bring objects into your drawings, tag them with metadata and use the graphical software development tools to create a digital representation of your paper-based sketches. With this information, you can more efficiently review, discuss and annotate your designs. And with Markup Assist, you can make changes to CAD models imported from paper. Markup Assistant will automatically interpret those changes, and display the new design on screen, making it easier to see what your changes are doing to the model.
