Q: Read in an image using Python I want to read an image file using Python. I would like to read in an image and extract just the gray scale image. So far, the only solution I've found is to use PIL. My only experience with PIL is that I had to import it in order to do the following. >>> from PIL import Image >>> im = Image.open("sunrise.jpg") >>> im.load() >>> im So that just loaded the image into the variable im. I would like to avoid that step. Is there another way? I want to be able to save the image as a JPEG. A: You can just read the image from the file system into a numpy array and then convert that to a PIL Image. import numpy as np import Image path = '/path/to/the/image.png' with open(path) as f: data = np.load(f) im = Image.fromarray(data) im.save(path, "jpeg"
