The Local Database Manager (LDM) is a feature of AutoCAD LT that allows the storage of user settings and drawing templates in a file system on the computer hosting the software. These can be reloaded by users of any AutoCAD version using the LDM file. The LDM file is located in the following folder for the 64-bit version of AutoCAD LT: C:\Program Files\AutoCAD\LT64\ldm. This folder is hidden by default, so the program must be run with administrative privileges to see it. It is a text file with a.ldm extension. (AutoCAD LT has a standard LDM file that looks a bit different.) In AutoCAD LT, it is important to note that the files stored in the LDM are not editable and must be either created or deleted using AutoCAD or the AutoCAD LT command line. Benefits ADF, i.e. the Graphical User Interface, was added to AutoCAD in 2002, but the software had already been adapted for use with tablets in its earlier years. The shape editor used for such operations was developed from scratch for AutoCAD by Mark Ovenden. The benefit of ADF was that it was developed in part using Apple technology and designed for multiple input devices. Multi-touch devices have been supported since AutoCAD 2002. In a presentation by Osborne Research, the firm determined that it costs CAD-related professionals \$6,600 per person per year to keep their CAD software current, so "for about \$15,000 annually, [the firm] could update each employee's system with the most recent release of [AutoCAD]

and not spend any time maintaining it." AutoCAD LT has been in development for over a decade, and has "been designed and tested with the needs of CAD/CAM/CAE professionals, such as the type of modeling and prototyping tasks that they perform, in mind". AutoCAD LT is an acronym for: L: Long-life support (10 years) D: Deployment-friendly (plug and run) T: Terminal (console) AutoCAD uses a Visual Basic for Applications (VBA) macro language which can be used to automate tasks, such as rotation, cutting, and exporting a drawing to formats other than AutoCAD drawings. Output: Q: Setting an Html.DisplayFor value in MVC I am working on a MVC 3 project using razor and using @Html.DisplayFor() method. How can I pass an object to the @Html.DisplayFor() method in MVC. I tried @Html.DisplayFor(model => item.Name) but this results in a null error. The property name is Name. How can I get it to display the Name property? A: Use DisplayFor(x=>item.Name) or if you want to explicitly specify the model property, use DisplayFor(x=>item.Name, "Foo") Q: My system is listening for USB ports. Is this safe? I have a simple bash script that uses netcat to watch for some USB devices being plugged in (it turns on power to the device). This part is definitely scary: # Detect and power on USB device while true do nc -q0 -l -p \$(get_port 0) sleep 1 done This works like a charm. However, I am asking myself if this is a good idea to be doing this? I am using a Raspberry Pi with no operating system running (there is no need for booting a Linux distro), only the bash script above. So is it safe to listen for USB ports? A: Why not use /etc/udev/rules.d/50-usb-power.rules? SU
