In the original strain albino mutants survived for only 24 hr. In contrast, outcrosses produced viable albino and eyed embryos that survived to birth. A genetic study was undertaken on five generations of backcrosses. The results indicate that the albino is controlled by a single recessive gene and is lethal. The genetic basis for this lethal mutation may be due to a reduced rate of embryonic development caused by a "marker" on the X chromosome.Q: How does FTP passwords work? I'm looking at switching to FTP instead of SFTP. I know basic stuff. But, I'm missing something. How do you transfer passwords and encryption keys? Do you FTP them? A: As you know, SFTP is secure because of the SSH crypto layer. So before the transfer, the server and the client must use a shared secret. This secret is the same for both sides, so it needs to be passed in cleartext. And that's where FTP stops being secure. It doesn't share the secret, so both the server and the client can potentially read it. Now, it should be possible to use a secure channel like OpenVPN to "fake" an FTP connection. If you don't like the idea of keeping this secret, you should use an ancillary channel like RDP that is only as secure as what's used for the login. A: FTP itself does not care about security. It's up to you. With SFTP, it is your responsibility to authenticate securely. The same goes for FTP, you need to perform authentication securely. SSH is 595f342e71
