Recently my PC wouldn't boot because it suspected an IO error. I was able to force a boot with a live disk, but it didn't give me any details on the errors. Would it be better to transfer the whole hard drive, or should I try to only transfer a certain partition or just leave it? Do other methods offer better chances for success? A: If you still can get access to your PC you can try to boot in Safe Mode. This might give you some more information regarding the disk errors. If you don't think that you'll get access to your PC again soon, I would recommend backing up your important files (if that's possible), and putting the drive in a self-test drive to try to test it and see if it passes. It may just be a bad drive - I've seen this happen with some laptops - but it's also a possibility that the drive is completely fried. It is possible that the system thinks the drive is failing because it's either not mounting or because it's unable to read certain sectors. In this case, you'd probably want to do a copy of all the important data to another drive (or several other drives) before replacing the drive. A: It's a very bad idea to attempt any sort of backup or repair during a state like this. At best you may come across a window of opportunity to successfully recover any data from an affected drive. In my experience it is better to blow it away, if you can't boot into safe mode, go to a known good working copy, copy out all the files and hope that when you replace the drive it works fine. Venezuela's embattled President Nicolás Maduro has unveiled a major package of economic reforms to try to kickstart an economy that has been sputtering in the aftermath of
