Which Version? There are three versions of Photoshop. * CS (Creative Suite): At the time this was written, CS had been published for many years and provides the easiest way to learn the basics of Photoshop. It is geared toward the professional

user and includes all the features available in the more expensive versions. The cost for Photoshop is approximately $1,469.99 to $2,099.99. The CS3 upgrade costs $299.99 and CS3 Extended upgrade costs $499.99. * Photoshop Elements: Photoshop Elements is a smaller, much less expensive version of Photoshop that allows you to edit digital photographs, graphics, and vector images. It costs about $169.99 for the standard version

and about $249.99 for the extended version. * Photoshop Lightroom: Photoshop Lightroom is a digital-imaging program geared toward professional photographers, although it can be used by both professionals and home users. At the time this book was written, Photoshop Lightroom had been released for a number of years and its feature set included local adjustments, RAW support, and organization of your images. The

cost for Photoshop Lightroom is $149.99.

Semiconductor devices are used in a variety of electronic applications, such as personal computers, cell phones, digital cameras, and other electronic equipment, as examples. Semiconductor devices are typically fabricated by sequentially depositing insulating or dielectric layers, conductive layers, and semiconductive layers of material over a semiconductor

substrate, and patterning the various material layers using lithography to form circuit components and elements thereon. A transistor is an example of a semiconductor device. There are various types of transistors, such as metal-oxide-semiconductor field-effect transistors (MOSFETs), dopant-activated transistors, bipolar transistors, and junction-transistor transistors, as examples. A MOSFET is one of

the more common transistor types. A MOSFET is a transistor used for amplifying or switching electronic signals and is formed of source and drain regions of a semiconductor material, such as silicon, and a channel region between the source and drain regions, as examples. In a finFET device, the channel region of a finFET is located between the source and drain regions of the finFET. The channel region is thinner than the

fin height, i.e., height of the fin between the source and drain regions, of the finFET device. The transistors in semiconductor devices, such as finFET devices, are often arranged in arrays, such as logic arrays and memory arrays. For logic arrays, the transistors are typically arranged in rows and columns in a horizontal or vertical configuration, as examples. For memory arrays, the transistors are typically arranged in rows

and columns in a horizontal or vertical configuration, as examples, where a particular memory element is disposed at each intersection of a row and column in the array. As feature sizes of semiconductor devices have decreased, it has become increasingly difficult to manufacture such devices with acceptable yields.Q: Best way to configure a large number of REST service. (too many) Let's say you have a large number of

REST requests to be served. Can you suggest a best way to configure / deploy those requests? I've already see how to configure them as a Spring MVC application, or a JAX-RS application or anything. But my doubt is that, how can you configure a huge number of REST services. The example which is easier to understand is one: @GET @Path("/countries")

Q: Loading ListView in fragment from asynctask I'm trying to implement a simple chat application. I want to load the listview in fragment from asynctask. here's my code:
Fragment ChatFragment1 = new Fragment(); ListView lvChat; public ChatFragment1() { // Required empty public constructor } @Override public View onCreateView(LayoutInflater

inflater, ViewGroup container, Bundle savedInstanceState) { // Inflate the layout for this fragment View v = inflater.inflate(R.layout.fragment_chat1, container, false); lvChat=(ListView)v.findViewById(R.id.list); new AlertData().execute(); return v; } class AlertData extends AsyncTask { @Override protected Void doInBackground(Void... params) { getAllData(token); return null; } } here's my getAllData(token)

method inside this class: public void getAllData(String token) { StringRequest stringRequest = new StringRequest(Request.Method.POST, ENDPOINT, new Response.Listener() { @Override public void onResponse(String response) { Toast.makeText(getActivity(), "Data Loaded: " + response, Toast.LENGTH_SHORT).show(); } }, new Response.ErrorListener() { @Override public
