Show HN: Real time visualization of time traffic patterns on a map - jimto <http://jimloyd.github.com/timevis/time-traffic.html> ===== patio11 Excellent presentation of information that I have no interest in learning about or purchasing an attachment to support. If you're going to be publicizing something, you have to figure out which demographic you are targeting. I'm not in the time traffic business, but this does not encourage me to think of my readers as \"time traffic\" businesspeople. It does not inspire me to think, \"Aha! I can write a 3-5 page explanation of this chart to people looking for a chart.\" It does not inspire me to think, \"Wow, I could waste a quarter of a day on studying this chart, generating an explanation, and uploading all of that to a website for a mere \$1,000.\" If you're going to sell something people really need, be succinct, be clear, and make it obvious they

can get it from another source. \ "Time traffic charts are awesome. Read about them, and then either buy charts from us or just click here to be awesome and follow me on Twitter for more awesome charts.\ " ~ ~ ~ jimto

Thanks for the feedback. We have already started to work on the blog explanation. ----- dkasper I can't tell if it's an apples to apples comparison, but when I used this chart for a traffic planner, it was surprising how different the outlook of a day was between 50% of the drivers for the morning and late afternoon commute. Many who had a tailback at 6am returned at 11am to find a ~ ~ ~ jimto It's exactly apples to apples. The traffic conditions never change.

The QuadCurve's spectrum analyser is even more extensive than the Sonitus Equalizer's. Click on the graph's pin symbol (top right of the window) to see the analyser. Then you can click on the different points to see the frequencies. To change the analyser settings, click on the graph's pin symbol and choose Post FX Rack. (If you're using the Sonitus Equalizer, the actual analyser settings follow the Sonitus EQ.) The Limiter controls how much signal the Sonitus Compressor will let through. The maximum and minimum values are 100 percent and 0 percent. In other words, if the compressor is set to 60 percent, the maximum is set to 60. If it's set to 40 percent, the maximum is set to 0. The Limiter controls how much signal the Sonitus Compressor will let through. The maximum and minimum values are 100 percent and 0 percent. In other words, if the compressor is set to 60 percent, the maximum is set to 60.

If it's set to 40 percent, the maximum is set to 0. But the Limiter can change those settings independently: it could be set to 60 for the left channel, and 20 for the right. That would mean the maximum would be a little more than 60 percent, the minimum about 5 percent. The Link controls for Feedback, Crossfeed, and Mix retain the absolute relationship between values, even when they're maxed out or set to minimum. In other words, suppose Mix is set to 80 percent in the left channel, and 20 percent in the right channel. If you reduce the left-channel Mix to 60 percent, the right channel will go to 0 percent. If you continue reducing the left-channel Mix, the right Mix will stay at 0. However, if you bring the left-channel Mix back up above 60 percent, the right channel 'remembers' that it was 60 percent lower than the left channel. So if you set the left channel to, say, 90 percent, the right channel Mix will change to 30.
