After about two hours of downloading, unzipping, and installing, the program seemed to be working properly for the first time. I have been using it for two weeks now, so I do not have anything to compare it to. The overall user interface is a bit barebones, but I don't know what else you can expect from such a minimalist program. The one place it has a number of features Photoshop lacks is in its brush and adjustment features. Photoshop brushes can be loaded in Elements and notated with adjustment layers, but there are no such brushes in the Elements program. I found myself creating custom brushes using the Brush panel in Photoshop and using them in Elements quite easily. I created simple artistic styles from paint and then used them to paint simple drawings and patterns in Elements (which is the first time I've thought of background paint as a real art form). The viewport and tools are similar to those in Photoshop, and the result is similar. I also like how the crop tool in Elements is a cross between the rectangular crop tool and the Crop tool in Photoshop, which only crops rectangular selections; these two tools are rarely interchangeable. The Masking tools in Elements seem very useful for creating multiple layers for images with varying backgrounds. The major issue is that the tools are very finicky about how you position the corners of a mask, and the mask is not parented to the image, so many tools move a mask as soon as the mask is selected. This can be a problem if you try to remove the mask to just leave the original or add over it to make a new one. I found most of the tools to be easy to use, as I also used them in Photoshop.

Select your Layers! This closes them, you then have the option to Split or merge them. Go ahead and click away. For a great selection of Layers to work with, you can come back to this page. It contains layers for various images you work with like your logo, wedding cake slices, features, or the bride and groom's faces. These can be useful when creating menus, registration cards, and more! To remove any unwanted parts, use the Eraser tool. To fix mistakes, use the Redo tool. Both of these tools are in the toolbox located on the left side of the screen. They work as you would imagine and are easy to use. Both tools have the ability to activate the Brush tool. You can use a built-in selection tool to isolate areas on a photo, and a freeform ellipse tool for sketchy shapes. You can draw on your image using the Pen Tool. After completing the drawing, the brush will transfer the line onto your image. You can also select an area of your image by holding down the Space bar and then applying the Brush tool. To edit your image more easily, you can select a grid pattern. If you do this, you can work in 100 percent enlargement and zoom in as much as you want. You can also easily resize your image. We use this a lot when editing our wedding albums. Using the Eyedropper tool, give some color to the image. This tells Photret OS to look at the color you've chosen, which can then be changed to another color. Once you have the color you want, go to the Channels palette. You can then edit any channel individually. Wrinkles, shadows, highlights, and more can be edited using this option. This can be hugely advantageous when editing skin tones. Simply increase or decrease the luminance (brightness) of any specific area using the Magic Wand tool. It changes the luminance of the selected area. e3d0a04c9c

Leverage on the dynamism and non-destructiveness of working with Photoshop layers. A change in the resolution of your image may result in a major change in the proportions of a puzzle — an effect that will have to be fixed later. To get around this, simply right-click on a layer, select “Convert to Smart Object” and instantly move the layer with the right-click menu. Same is applicable for groups. Click on the layer or group tab, right-click and select “Convert to Smart Object” and then move or copy layers or groups by moving different elements of the smart object. Not all objects behave the same way. “V”s should always be separate from “I”s. Both should always be separate from “Q”s. Now that you can introduce your own custom type to a layer or to a group, you have to account for this. Type a “V” on a layer, right-click on it and select “Create Outlines”. Type a “I” on a group, right-click and choose “Create Guides”. Introduce the custom type that you want and move them to a layer or to a group. You may add more of the same type. In other words, V’s should not be grouped. In turn, you will have to spread all the V’s onto a separate layer. Identifying and duplicating layers is an important time-saving procedure. To help you save time as much as possible, **If you append existing layers and group to a group by clicking the “Group From Layer” option, they will be added to the group in the same order they are appended.** A soft mask has a floating cut around it, allowing both the mask and the visible area to blend together. A hard mask nests to the layer it is applied to. If you want to mask a small section of the image with a hard-edged cut, double-click on the layer and choose “Create Hard Mask”.
